Notes

 Recommended concrete strengths for various uses are shown in the table below.

| Concrete strength at 28 days, MPa | Use | | | | |
|---|---|--|--|--|--|
| 10 | Mass filling | | | | |
| 15 | Foundations for houses | | | | |
| 20 | Floors on the ground (surface beds) for houses | | | | |
| 25 | Reinforced concrete Home driveways | | | | |
| 30 | Reinforced concrete Floors on the ground for heavy duty – e.g. factories Farm roads | | | | |
| 35 | Floors on the ground for heavy duty – e.g. factories Precast concrete | | | | |
| 40 | Precast concrete | | | | |

- All cement sold in South Africa must meet the requirements of SANS 50197 for Common cement or SANS 50413 for Masonry cement and the National Regulator for Compulsory Standards (NRCS) requirements as detailed in NRCS VC9085. Bags should be clearly marked with the strength grade, notation indicating composition and a Letter of Authority (LOA) number issued by the NRCS. An LOA is issued for each cement type from each source. To verify valid LOA numbers contact the NRCS on 012 428 5199 or www.nrcs.org.za.
- Mix proportions in the table overleaf are based on the assumption that a CEM II/A 32,5 cement will be used. CEM I 42,5 or higher strength cements will give a stronger concrete but may be less economical. Cements with higher extender contents (e.g. CEM II/B or CEM III) will develop strength more slowly and will require particular care with curing. Masonry cements complying with SABS ENV 413-1 are not recommended for use in concrete.

The amount of water required is not given in the table. The
mix should contain enough water to achieve the required
consistence. Consistence may be assessed by eye or
measured by carrying out the slump test
(SABS Method 5862-1:2006). Recommended slumps are:

50–100 mm for compaction by mechanical vibration 100–150 mm for compaction by hand

• 0,001 m³ = 1 litre

The capacity of a builder's wheelbarrow is 65 litres.

 A mix made according to this table, and to the required consistence, should be assessed for stone content before being used on a large scale. This can be done by compacting some of the concrete in a container, e.g. a bucket, by the means (vibration or hand tamping) to be used on the job.

If stones protrude from the surface, stone content is too high.

If not, scratch the surface of the compacted concrete (before it hardens) with a nail or screwdriver. If the stone content is right, stones should be found two or three millimetres below the surface. If they are deeper than this, the stone content is too low.

If stone content is too high, reduce it by 10% and increase sand content by the same amount, i.e. volume or mass. Then reassess.

If stone content is too low, increase it by 10% and reduce sand content by the same amount, i.e. volume or mass. Then reassess.

- The mix proportions given in the table overleaf are conservative. If the quantity of concrete to be made exceeds about 100 m³, it is probably possible to save costs by selecting materials and having a mix designed. For information on the choice of materials consult Cement & Concrete SA.
- The quantities given overleaf do not include any allowance for wastage.
